

Maintenance Manager

Asset information, parts ordering and maintenance scheduling
at your fingertips

Maintenance Manager

Asset information, parts ordering and maintenance scheduling at your fingertips

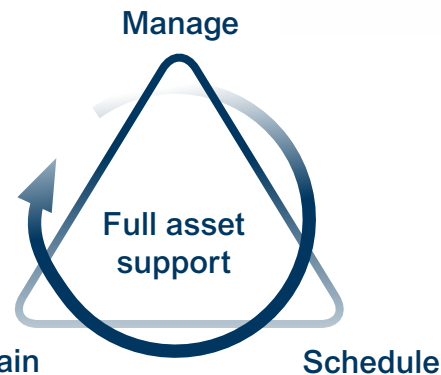

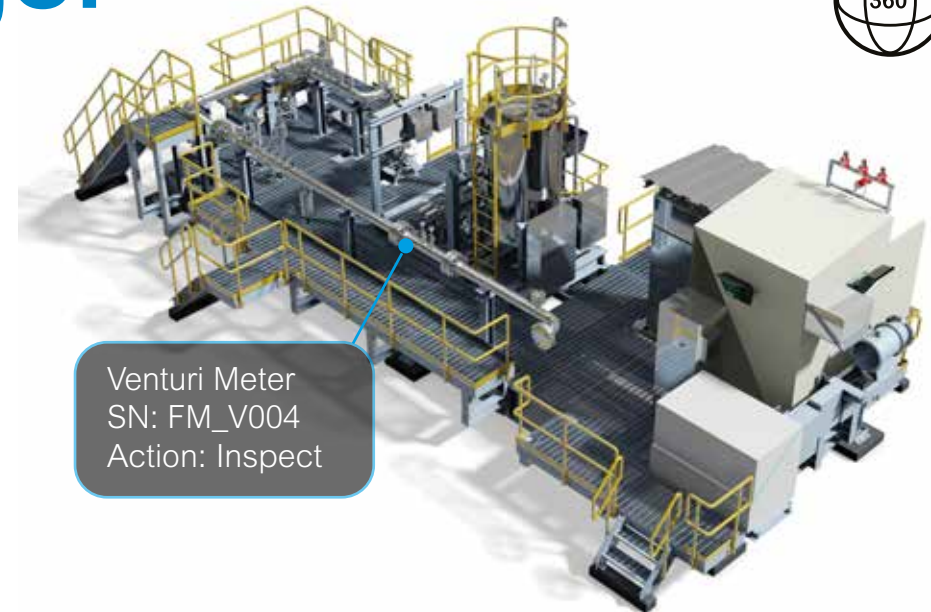

Digital efficiency

Maintenance Manager is an intuitive, fully digital and scalable solution to support operators, project managers and technicians with all their operation and maintenance activities.

On-site performance

On-site, technicians and operators can access all key information via an easily searchable digital document library on a zone-rated tablet device.

This includes fully rendered and navigable asset graphics – enhancing speed, efficiency and performance of maintenance activities.

Typical asset information includes:

- operation and maintenance manuals
- general arrangement diagrams
- parts listing with push-deploy spares ordering

Built-in maintenance scheduling

For maintenance managers, planners and remote stakeholders, workflows and maintenance tasks can be scheduled and push-deployed to the on-site technicians via syncing.

And with two-way feedback, including the ability for technicians to action workflows and upload relevant information and media directly into the tablet device, maintenance efficiency, traceability, visibility and security are all taken to the next level.
